A quick and easy-to-use tool to calculate with the Reverse Polish Notation. It supports all the basic operations: addition, subtraction, multiplication, division, natural logarithm, as well as trigonometric functions, fractions, exponents, roots and a couple of more special functions. It can be used with the support of three different angle modes (radian, deg, grad). Excalibur comes with a professional, customizable look and feel to its appearance. With this mode, a user can easily distinguish between the displayed data and the result in a more straightforward way. A special feature of this app is that it calculates to more than 12 significant figures, so no matter how large or small the entered number is, a high degree of accuracy will be achieved. The user interface of the program is based on a standard window with a familiar layout. Thus, it is possible to access functions and clear the results according to the user's bank. Therefore, the user can effortlessly operate on the entire stack, check system usage statistics and define a custom set of functions, as well as configure program settings (e.g. angle mode, numpad lock, comma format, footprint size, tax constant). The software program runs on a very low amount of CPU and system memory, so it is not a concern to the computer's resources. It has a good response time and includes a help file. We have not come across any problems in our tests, since Excalibur did not freeze, crash or pop up error dialogs. All in all, this app should please all users who require a full-featured RPN calculator. Unfortunately, no recent updates have been made.
